

Annual CO₂ Emission overview by countries

CO₂ Emission

- per capita
- by countries
- between 1860–2020
- comparing to population
- for selected Region

Greenhouse gas emissions from human activities are the main drivers of this warming. How are emissions changing in each country? Is your country making progress on reducing emissions? Human emissions of carbon dioxide and other greenhouse gases – are a primary driver of climate change – and present one of the world’s most pressing challenges.

Anthropogenic greenhouse gas emissions have increased since the pre-industrial era, driven largely by economic and population growth, and are now higher than ever. This has led to atmospheric concentrations of carbon dioxide, methane and nitrous oxide that are unprecedented in at least the last 800 000 years. Their effects, together with those of the other anthropogenic drivers, have been detected throughout the climate system and are extremely likely to have been the dominant cause of the observed warming since the mid 20th century.

By Sector

Global greenhouse gas emissions continue to rise, at a time when they need to be rapidly falling. To effectively reduce emissions we need to know where they are coming from – which sectors contribute the most?

Energy

Agriculture, forestry, land

Industrial,
